Cell resistance vs. illuminance

A. Measured with the light source of a tungsten lamp operated at a color temperature of 2856K.

B. Measured 10 seconds after removal of incident illuminance of 10 lux.

C. Gamma characteristic between 10 lux and 100 lux and given by $\frac{\log(R100)-\log(R10)}{\log(E100)-\log(E10)}$

Where R100, R10: cell resistances at 100 lux and 10 lux respectively
E100, E10: illuminances of 100 lux and 10 lux respectively

D. The rise time is the time required for the cell conductance to rise to 63% of the saturated level. The decay time is the time required for the cell conductance to decay from the saturated level to 37%.

E. All characteristics are measured with the light history conditions: the CdS cell is exposed to light (100 to 500 lux) for one to two hours.

Cell resistance vs. temperature
