description

The '165 and 'LS165A are 8-bit serial shift registers that shift the data in the direction of Q_A toward Q_H when clocked. Parallel-in access to each stage is made available by eight individual direct data inputs that are enabled by a low level at the shift/load input. These registers also feature gated clock inputs and complementary outputs from the eighth bit. All inputs are diode-clamped to minimize transmission-line effects, thereby simplifying system design.

Clocking is accomplished through a 2-input positive-NOR gate, permitting one input to be used as a clock-inhibit function. Holding either of the clock inputs high inhibits clocking and holding either clock input low with the shift/load input high enables the other clock input. The clock-inhibit input should be changed to the high level only while the clock input is high. Parallel loading is inhibited as long as the shift/load input is high. Data at the parallel inputs are loaded directly into the register while the shift/load input is low independently of the levels of the clock, clock inhibit, or serial inputs.

PARAMETER MEASUREMENT INFORMATION

NOTES: A. The remaining six data inputs and the serial input are low.
 B. Prior to test, high-level data is loaded into H input.
 C. The input pulse generators have the following characteristics: PRR ≤ 1 MHz, duty cycle $\leq 50\%$, $Z_{out} \approx 50 \Omega$; for '165, $t_r \leq 10$ ns, $t_f \leq 10$ ns;
 for 'LS165A, $t_r \leq 15$ ns, $t_f \leq 6$ ns.
 D. For '165, $V_{ref} = 1.5$ V; for 'LS165A, $V_{ref} = 1.3$ V.
